2.5 Strike bucket analiza

Kritično: što veći strike, to veći refund rate. Cijena se ne pomakne dovoljno da hit-uje barijeru ni s jedne strane.

2.6 MAE vs MFE analiza

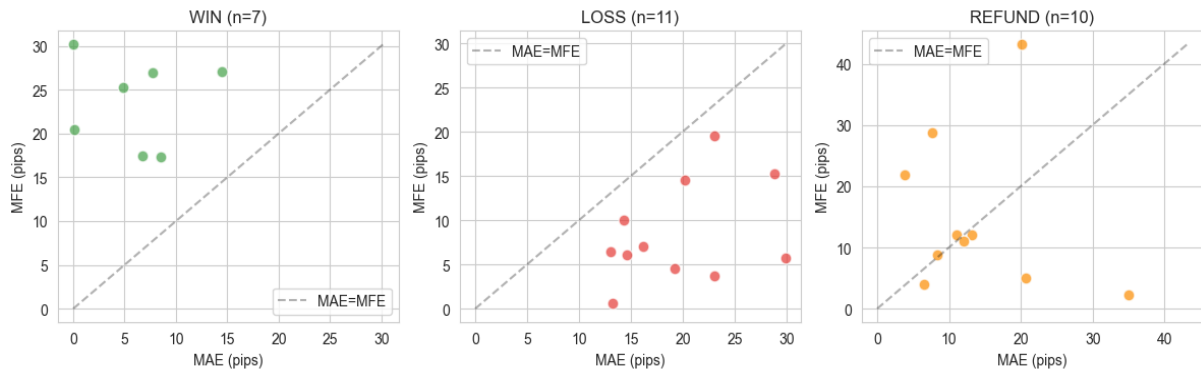

MAE (Maximum Adverse Excursion) = najveći gubitak prije settlement-a.

MFE (Maximum Favorable Excursion) = najveći dobitak prije settlement-a.

Kod WIN signala MFE mora biti $\geq$ strike. Kod LOSS signala MAE $\geq$ strike.

REFUND znači da ni jedan ni drugi nije bio dosegnut.

MAE vs MFE po outcome-u (kako se cijena ponašala)

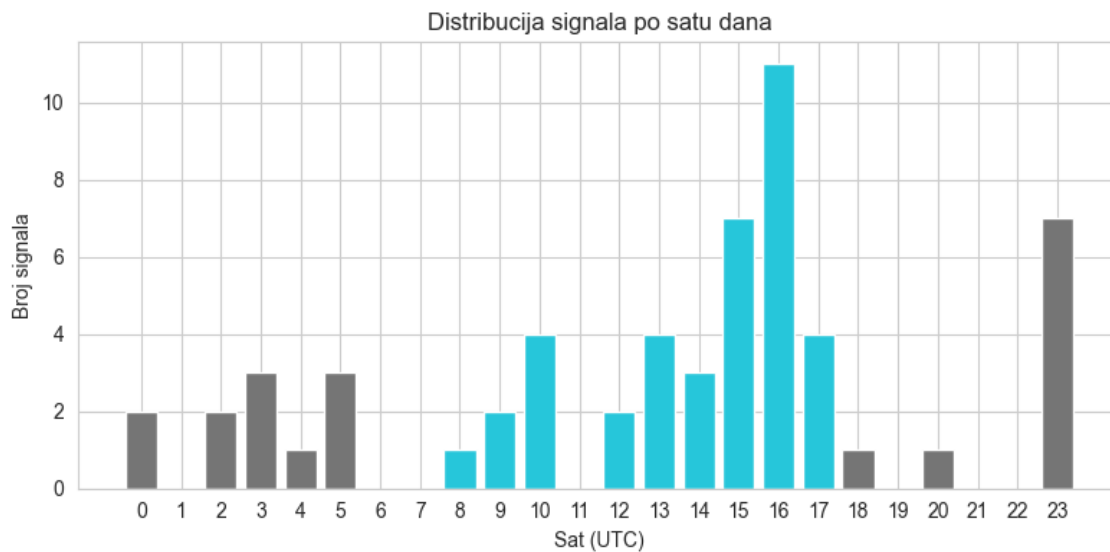

MAE/MFE prosjeci:

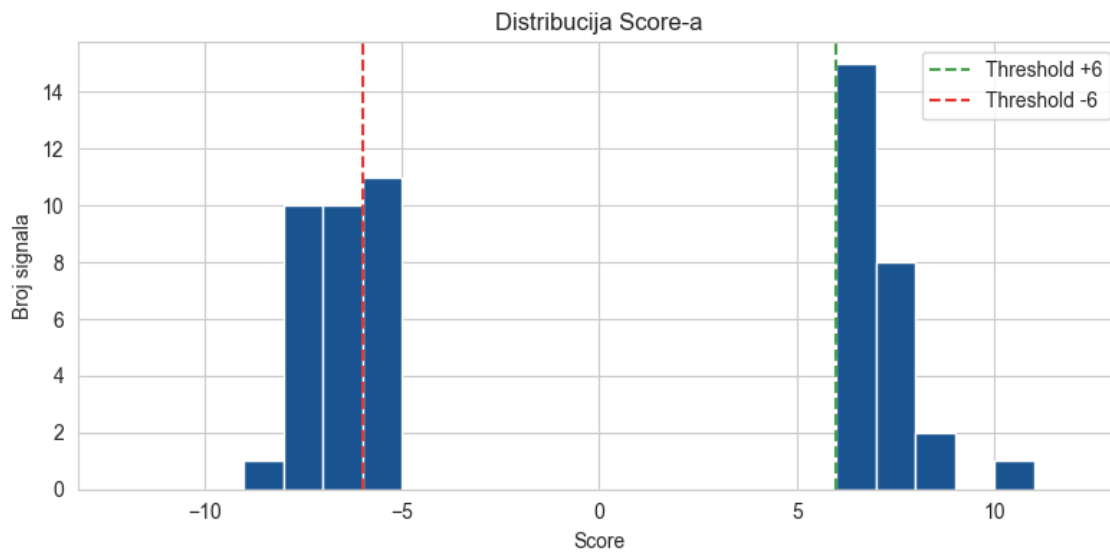

- **WIN:** MAE prosjek = 6.1p | MFE prosjek = 23.5p | n = 7
- **LOSS:** MAE prosjek = 19.6p | MFE prosjek = 8.5p | n = 11
- **REFUND:** MAE prosjek = 13.8p | MFE prosjek = 14.9p | n = 10

§5. Ključni nalazi i preporuke

- **X NIZAK WIN RATE:** 25.0% (premalo, treba $\geq 52.6\%$)
- **! VISOK REFUND RATE:** 35.7% — strike-ovi su preveliki za stvarno tržišno kretanje
- **! Strike >25p:** refund rate 62% (n=8) — preveliki strike
- BUY WR: 29% (n=17) | SELL WR: 18% (n=11)
- WIN trades: MAE = 6.1p (mala adverzija = clean entries)
- LOSS trades: MFE = 8.5p (puno predala se prije nego trend)
- Najaktivniji sat za H1: **16:00 UTC**
- *Sample 28 outcomes - treba 50+ za pouzdane zaključke*
- **PREPORUKE:**
 - 1. Smanjiti ATR multiplikator (1.2→1.0, 1.5→1.3, 1.8→1.5) - manji strike-ovi
 - 2. Razmotriti SMA200 hard filter i u H1 scanner-u (sad je samo M15)
 - 3. Filter signala s pips/hour > 3.5 - vjerojatno netočni
 - 4. Sačekati još 7-14 dana podataka prije velikih promjena
